- General discussion on line drawing

# What is Digital Differentiation?

- Differentiation of a continuous function  $f(x)$  with respect to  $x$ :

$$f' = \frac{df}{dx} = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{(x+h) - x}$$

$y = f(x)$   
 $y = mx + c$   
 $y = f(x)$

- $h$  is the minimum change in  $x$  ( $\Delta x$ ) which causes a change in  $f(x) = y =$

- For discrete plane:  $h \neq 1$

- Differentiation of a discrete function  $f(x)$  with respect to  $x$ :

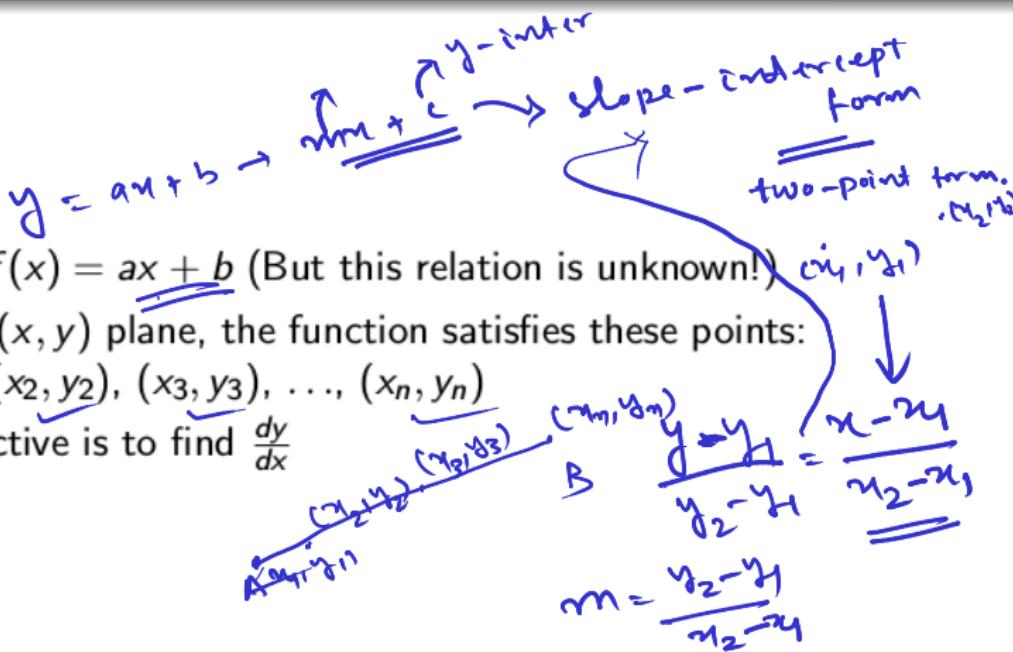

$$\frac{df}{dx} = \frac{f(x+1) - f(x)}{(x+1) - x} = (f(x+1) - f(x))$$

$x=0, f(x)=y$   
 $x=1, f(x)=y$   
 $x=2, f(x)=y$

$x=0, f(x)$   
 $x=0.5, f(x)$   
 $x=1, f(x)$

$$x_{i+1} = x_i + 1 \quad x_{i+1} = x_i + 1 \quad y_{i+1} - y_i = y_{i+1} - y_i = \frac{y_{i+1} + y_i}{2}$$

# Digital Differentiation on a function

# Digital Differentiation on a function

- Let  $\frac{dy}{dx} = f'(x)$

- $f'(x)$  can be defined as:

$$f'(x) = (f(x+1) - f(x))$$

- $f'(x)|_{x=x_i}$

- $= (f(x+1)|_{x=x_{i+1}} - f(x)|_{x=x_i})$

- $= (y_{i+1} - y_i)$

$$f' = \underline{\underline{y_{i+1}}} - \underline{\underline{y_i}}$$

discrete form

$$(x+1) - x =$$

$$H(x) |_{x=x_{i+1}}$$

$$H(x) |_{x=x_i}$$

$$(x_i, y_i)$$

$$f'(x) |_{x=x_i}$$

$$f' = \frac{y_2 - y_1}{x_2 - x_1}$$

$$f' = \underline{\underline{y_2}} - \underline{\underline{y_1}}$$

$$= \underline{\underline{y_{i+1}}} - \underline{\underline{y_i}}$$

$$y_{i+1} = f + \underline{\underline{y_{i+1}}}$$

$$\cdot (x_{i+1}, \underline{\underline{y_{i+1}}})$$

# DDA Line Drawing Algorithm

(DDA: Digital Differential Analyzer)

## Formation of DDA

- Cartesian *slope-intercept equation* for a straight line:

$$y = m \cdot x + b \quad \checkmark$$

$$\bullet m = \frac{y_2 - y_1}{x_2 - x_1} \quad \checkmark$$

$$\bullet b = y_1 - m \cdot x_1$$

OR

$$\checkmark b = y_2 - m \cdot x_2$$

$$(y_2, x_2)$$

$$(y_1, x_1)$$

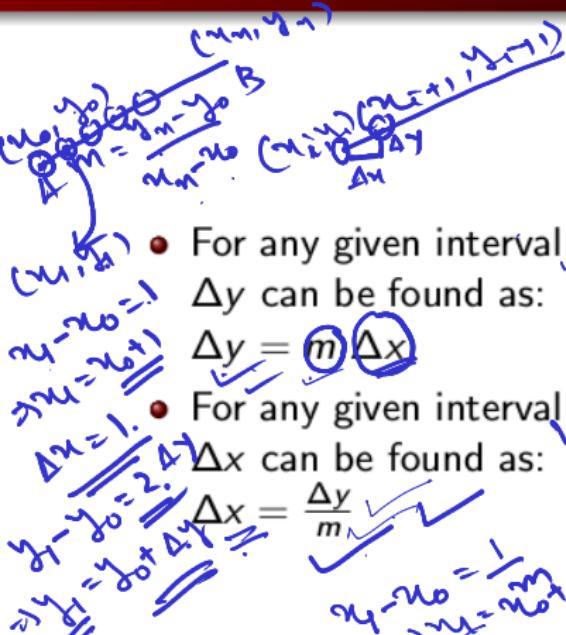

$$y_1 = mx_1 + b$$

$$\Rightarrow b = \underline{\underline{y_1 - mx_1}}$$

$$y_2 = mx_2 + b$$

$$\therefore b = \underline{\underline{y_2 - mx_2}}$$

## Formation of DDA

- For any given interval  $\Delta x$  along a line,  
 $\Delta y$  can be found as:

$$\Delta y = m \Delta x$$

- For any given interval  $\Delta y$  along a line,  
 $\Delta x$  can be found as:

$$\Delta x = \frac{\Delta y}{m}$$

DDA

$$y_i \rightarrow y_{i+1}$$

$$\Delta y = y_{i+1} - y_i \rightarrow \Delta y = m \Delta x$$

$$y_1 - y_0 = \Delta y = 1$$

$$y_2 - y_1 = m(y_2 - y_1)$$

$$y_1 - y_0 = 1$$

$$\Delta y = 1$$

$$\Delta x, \Delta y$$

$$y_1 = y_0 + \Delta y$$

$$x_1 = x_0 + \Delta x$$

Formation of DDA, when  $|m| \leq 1$ 

When  $|m| \leq 1$ , with a given point  $(x_k, y_k)$  lying on the line, the next point can be found as:

$$y_{k+1} - y_k = m(x_{k+1} - x_k)$$

where,  $\Delta y = (y_{k+1} - y_k)$ , and  $\Delta x = (x_{k+1} - x_k)$

Case 1:  $m = 0$

Case 2:  $|m| < 1$

$m = \tan \theta$

$\Delta y = m \Delta x$

$\Delta x = \frac{\Delta y}{m}$

$(x_0, y_0)$   $(x_1, y_1)$   $(x_2, y_2)$   $(x_3, y_3)$   $(x_4, y_4)$   $(x_5, y_5)$   $(x_6, y_6)$   $(x_7, y_7)$   $(x_8, y_8)$   $(x_9, y_9)$   $(x_{10}, y_{10})$   $(x_{11}, y_{11})$   $(x_{12}, y_{12})$   $(x_{13}, y_{13})$   $(x_{14}, y_{14})$   $(x_{15}, y_{15})$   $(x_{16}, y_{16})$   $(x_{17}, y_{17})$   $(x_{18}, y_{18})$   $(x_{19}, y_{19})$   $(x_{20}, y_{20})$   $(x_{21}, y_{21})$   $(x_{22}, y_{22})$   $(x_{23}, y_{23})$   $(x_{24}, y_{24})$   $(x_{25}, y_{25})$   $(x_{26}, y_{26})$   $(x_{27}, y_{27})$   $(x_{28}, y_{28})$   $(x_{29}, y_{29})$   $(x_{30}, y_{30})$   $(x_{31}, y_{31})$   $(x_{32}, y_{32})$   $(x_{33}, y_{33})$   $(x_{34}, y_{34})$   $(x_{35}, y_{35})$   $(x_{36}, y_{36})$   $(x_{37}, y_{37})$   $(x_{38}, y_{38})$   $(x_{39}, y_{39})$   $(x_{40}, y_{40})$   $(x_{41}, y_{41})$   $(x_{42}, y_{42})$   $(x_{43}, y_{43})$   $(x_{44}, y_{44})$   $(x_{45}, y_{45})$   $(x_{46}, y_{46})$   $(x_{47}, y_{47})$   $(x_{48}, y_{48})$   $(x_{49}, y_{49})$   $(x_{50}, y_{50})$   $(x_{51}, y_{51})$   $(x_{52}, y_{52})$   $(x_{53}, y_{53})$   $(x_{54}, y_{54})$   $(x_{55}, y_{55})$   $(x_{56}, y_{56})$   $(x_{57}, y_{57})$   $(x_{58}, y_{58})$   $(x_{59}, y_{59})$   $(x_{60}, y_{60})$   $(x_{61}, y_{61})$   $(x_{62}, y_{62})$   $(x_{63}, y_{63})$   $(x_{64}, y_{64})$   $(x_{65}, y_{65})$   $(x_{66}, y_{66})$   $(x_{67}, y_{67})$   $(x_{68}, y_{68})$   $(x_{69}, y_{69})$   $(x_{70}, y_{70})$   $(x_{71}, y_{71})$   $(x_{72}, y_{72})$   $(x_{73}, y_{73})$   $(x_{74}, y_{74})$   $(x_{75}, y_{75})$   $(x_{76}, y_{76})$   $(x_{77}, y_{77})$   $(x_{78}, y_{78})$   $(x_{79}, y_{79})$   $(x_{80}, y_{80})$   $(x_{81}, y_{81})$   $(x_{82}, y_{82})$   $(x_{83}, y_{83})$   $(x_{84}, y_{84})$   $(x_{85}, y_{85})$   $(x_{86}, y_{86})$   $(x_{87}, y_{87})$   $(x_{88}, y_{88})$   $(x_{89}, y_{89})$   $(x_{90}, y_{90})$   $(x_{91}, y_{91})$   $(x_{92}, y_{92})$   $(x_{93}, y_{93})$   $(x_{94}, y_{94})$   $(x_{95}, y_{95})$   $(x_{96}, y_{96})$   $(x_{97}, y_{97})$   $(x_{98}, y_{98})$   $(x_{99}, y_{99})$   $(x_{100}, y_{100})$

Formation of DDA, when  $|m| \leq 1$  $(x_n, y_n)$ 

$$m = ?$$

---

- We vary values of  $x$  incrementally,  
i.e.,  $x_{k+1} = x_k + 1$

 $(x_0, y_0)$ 

- Hence the equation  $y_{k+1} - y_k = m(x_{k+1} - x_k)$  reduces to,  
 $y_{k+1} = y_k + m$

$$\Rightarrow y_{k+1} = m + y_k \quad \textcircled{1}$$

- If we start from a point and vary values of  $x$  in decreasing order,

i.e.,  $x_{k+1} = x_k - 1$

 $(x_n, y_n)$ 

$$x_{k+1} = x_k - 1$$

---

- Hence the equation  $y_{k+1} - y_k = m(x_{k+1} - x_k)$  reduces to,

$$y_{k+1} = y_k - m$$

$$\Delta y = m \cdot \Delta x$$

$$y_{k+1} - y_k = -m$$

$$\Rightarrow y_{k+1} = y_k - m$$

---

# Analysis of DDA algorithm

## General line drawing

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

### Operations needed:

Multiplication: 02

Addition: 04

$m = \frac{y_2 - y_1}{x_2 - x_1}$  can be calculated once and can be stored.

### Reduced operation:

Multiplication: 01

Addition: 02

## DDA line drawing

$$x_{k+1} = x_k + 1$$

$$y_{k+1} = y_k + m$$

### Operations needed:

Multiplication: 00

Addition: 01

In every step, previous location needs to be stored.

## A simple example by DDA

Find the coordinate of raster points on the straight line joining (20, 10) and (30, 18)

# A simple example by DDA

$m = \frac{18-10}{30-20} = 0.8 (< 1) \Rightarrow x$  will be varied incrementally.

$x$	Actual $y (= y_1)$	$y$ by DDA algorithm (wrong)	$y$ by DDA algorithm (= $y_2$ ) (wrong?)	$y$ by DDA algorithm (= $y_3$ ) (correct)
20	10.0	10.0	10.0	10.0
21	10.8	$10 + 0.8 = 10$	$10.0 + 0.8 = 10.8 \approx 10$	$10.0 + 0.8 = 10.8 \approx 11$

- Number of non-zero element in  $y''_3$  : 4
- Can this be used for comparing goodness of two outputs? **NO**
- Can this be used for comparing goodness of plot with own vector version? **YES**

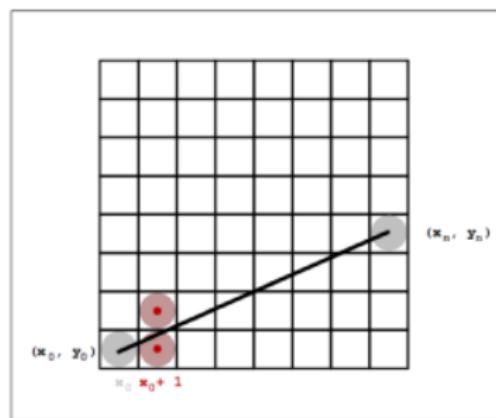

# Bresenham's Line Drawing Algorithm

# Introduction from equation of a line

- Cartesian *slope-intercept* equation for a straight line:

$$y = m \cdot x + b$$

- Given a point  $(x_k, y_k)$ , we want to decide what will be the value of  $(x_{k+1}, y_{k+1})$ ?

## Why a decision parameter?

- When  $|m| \leq 1$ :

$$x_{k+1} = x_k + 1$$

$y_{k+1} = y_k$  OR  $y_{k+1} = y_k + 1$  (based on decision parameter)

- When  $|m| > 1$ :

$$y_{k+1} = y_k + 1$$

$x_{k+1} = x_k$  OR  $x_{k+1} = x_k + 1$  (based on decision parameter)

## Significance of decision parameter

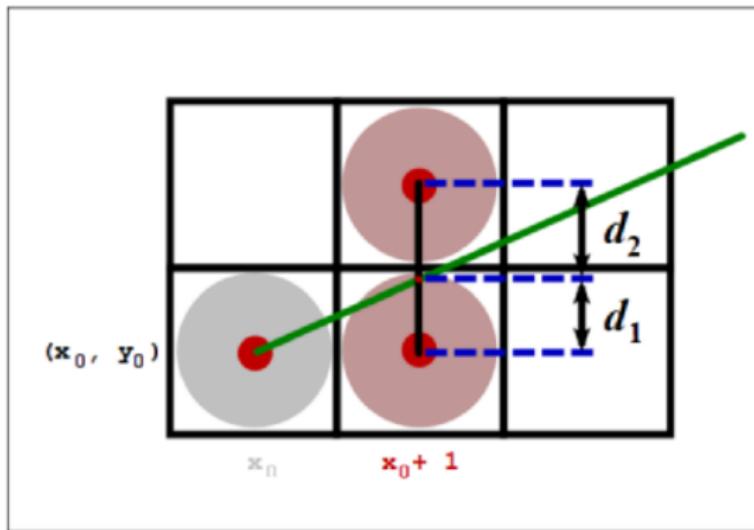

Figure : Significance of decision parameter

# Formation of the decision parameter

- $y_k = mx_k + b \Rightarrow y_{k+1} = m(x_{k+1}) + b$
- For  $|m| \leq 1$ ,  $x_{k+1} = x_k + 1$
- We define  $d_1$  as:

$$d_1 = y_{k+1} - y_k = m(x_k + 1) + b - y_k$$

- We define  $d_2$  as:
- $d_2 = (y_k + 1) - y_{k+1} = y_k + 1 - m(x_k + 1) - b$
- $d_1 - d_2 = 2m(x_k + 1) - 2y_k + 2b - 1$

# Formation of the decision parameter

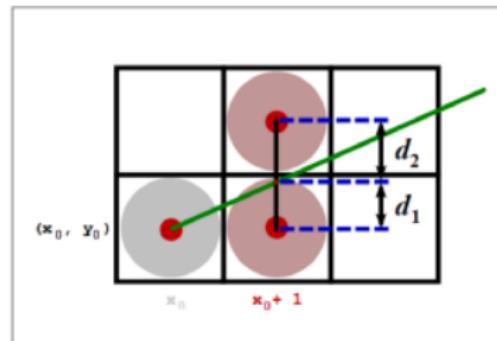

- Decision Parameter  $p_k$ 
$$\begin{aligned} &= \Delta x(d_1 - d_2) \\ &= \Delta x[2m(x_k + 1) - 2y_k + 2b - 1] \\ &= 2\Delta y \cdot x_k - 2\Delta x \cdot y_k + c \end{aligned}$$
where,  $m = \frac{\Delta y}{\Delta x}$ , and  $c = 2\Delta y + \Delta x(2b - 1)$
- $c$  is a constant

# Formation of the decision parameter

- $p_k = \text{function}(x_k, y_k) = 2\Delta y \cdot x_k - 2\Delta x \cdot y_k + c$
- $p_{k+1} = \text{function}(x_{k+1}, y_{k+1}) = 2\Delta y \cdot x_{k+1} - 2\Delta x \cdot y_{k+1} + c$
- $p_{k+1} - p_k = 2\Delta y(x_{k+1} - x_k) - 2\Delta x(y_{k+1} - y_k)$
- We already know: for  $|m| \leq 1$ ,  $x_{k+1} = x_k + 1$
- $p_{k+1} = p_k + 2\Delta y - 2\Delta x(y_{k+1} - y_k)$  ( $\forall k \geq 0$ )
- $p_0 = ???$

# Finding $p_0$

- $p_0$ 
$$\begin{aligned} &= \Delta x(d_1 - d_2) \\ &= \Delta x(2d_1 - 1) \\ &\text{(as } d_1 + d_2 = 1\text{)} \end{aligned}$$
- Slope ( $m$ )
$$\begin{aligned} &= \frac{\Delta y}{\Delta x} \text{ (in general)} \\ &= \frac{d_1}{1} \end{aligned}$$
- $p_0$ 
$$\begin{aligned} &= \Delta x(2m - 1) \\ &= \Delta x\left(2\frac{\Delta y}{\Delta x} - 1\right) \\ &= 2\Delta y - \Delta x \end{aligned}$$

# Formation of the decision parameter

- Decision Parameter

$$p_k = \Delta x(d_1 - d_2) \text{ where } \Delta x > 0$$

- Sign of  $p_k$  depends on sign of  $(d_1 - d_2)$

- $p_{k+1} =$

$$p_k + 2\Delta y - 2\Delta x(y_{k+1} - y_k) \\ (\forall k \geq 0)$$

- IF  $p_k < 0$ ,

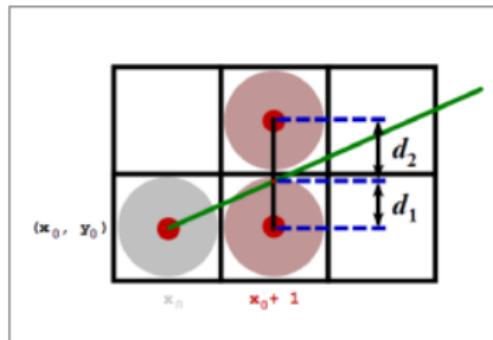

$$d_2 > d_1 \Rightarrow y_{k+1} = y_k$$

$$p_{k+1} = p_k + 2\Delta y$$

- OTHERWISE,

$$d_1 > d_2 \Rightarrow y_{k+1} = y_k + 1$$

$$p_{k+1} = p_k + 2\Delta y - 2\Delta x$$

# Bresenham's line drawing algorithm with $|m| \leq 1$

- ① Input:  $(x_0, y_0)$  and  $(x_n, y_n)$  such that  $|m| \leq 1$   
(assume  $x_0 < x_n$  without loss of generality)
- ② Calculate  $\Delta x, \Delta y, 2\Delta y$ , and  $(2\Delta y - 2\Delta x)$
- ③ Load  $(x_0, y_0)$
- ④  $p_0 \leftarrow (2\Delta y - \Delta x)$
- ⑤  $k \leftarrow 0$
- ⑥ if  $(p_k < 0)$   
Load  $(x_k + 1, y_k)$   
 $p_{k+1} \leftarrow p_k + 2\Delta y$
- ⑦ Otherwise  
Load  $(x_k + 1, y_k + 1)$   
 $p_{k+1} \leftarrow p_k + (2\Delta y - 2\Delta x)$
- ⑧  $k \leftarrow (k + 1)$
- ⑨ Repeat steps 6,7,8 for  $\Delta x$  times

## A simple example by BLD

Find the coordinate of raster points on the straight line joining (20, 10) and (30, 18)

# A simple example by BLD

$$m = \frac{18-10}{30-20} = 0.8 (< 1)$$

$\Rightarrow x$  will be varied

incrementally.

$$\Delta x = 30 - 20 = 10,$$

$$\Delta y = 18 - 10 = 8,$$

$$2\Delta y = 16,$$

$$\text{and } (2\Delta y - 2\Delta x) = -4$$

$k$	$p_k$	$x_{k+1}$	$y_{k+1}$
0	6	21	11
1	2	22	12
2	-2	23	12
3	14	24	13
4	10	25	14
5	6	26	15
6	2	27	16
7	-2	28	16
8	14	29	17
9	10	30	18

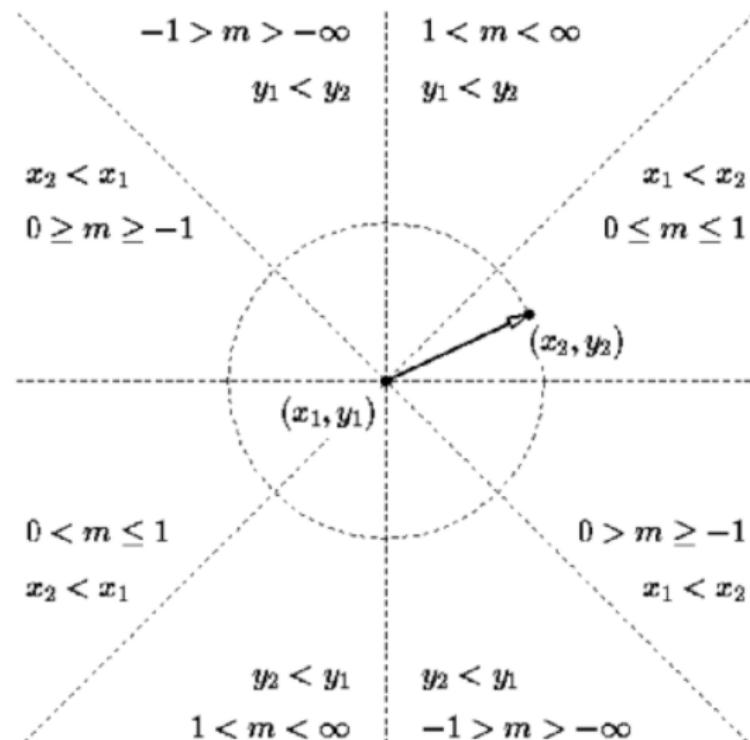

## Comparing DDA and BLD on this example

x	y by DDA	y by BDS
20	10	10
21	11	11
22	12	12
23	12	12
24	13	13
25	14	14
26	15	15
27	16	16
28	16	16
29	17	17
30	18	18

## Why understanding an algorithm for $|m| < 1$ is sufficient?

- DDA and BLD are sequential line drawing algorithms
- They decide on position of points one by one
- As position of  $k$  th point depends on position of  $(k - 1)$ th point, we need to evaluate  $(k - 1)$  th point before  $k$  th.
- This nature restricts the algorithms to exploit parallelism (concurrent plotting of points)

# Why understanding an algorithm for $|m| < 1$ is sufficient?

# Why understanding an algorithm for $|m| < 1$ is sufficient?

- Reflection along lines  $x = 0$ ,  $y = 0$ ,  $x = y$ , and  $x = -y$  are less computation intensive
- We can find a reflected version of every given line where  $|m| < 1$  holds good for reflected version

## How to choose the axis for iteration?

- We choose to vary  $x$  axis when  $|m| \leq 1$
- We choose to vary  $y$  axis when  $|m| > 1$
- (WHY?)

## How to choose the axis for iteration?

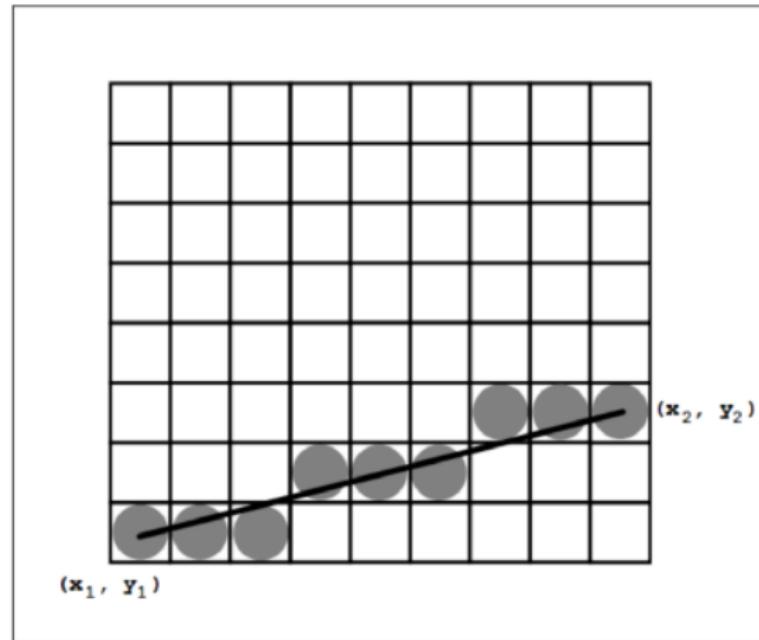

Figure : Going through x axis when  $|m| \leq 1$

## How to choose the axis for iteration?

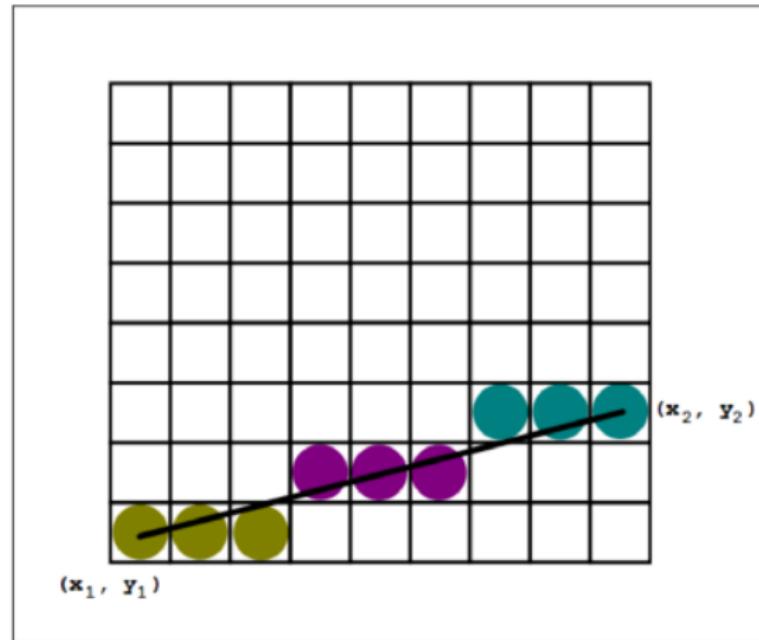

Figure : Going through y axis when when  $|m| \leq 1$

## How to choose the axis for iteration?

- Constraint 1: To generate maximum number of points with membership to the line
- Constraint 2: Not neglecting any point with membership to the line
- Constraint 3: Maintaining the 8-neighbourhood connectivity

## How to choose the axis for iteration?

- Constraint 1: To generate maximum number of points with membership to the line
- Constraint 2: Not neglecting any point with membership to the line
- Constraint 3: Maintaining the 8-neighbourhood connectivity

## How to draw two parallel lines?

- We need to draw two lines
- one between  $(x_1, y_1)$  and  $(x_2, y_2)$ , and another between  $(x_3, y_3)$  and  $(x_4, y_4)$
- such that  $\frac{(y_2-y_1)}{(x_2-x_1)} = \frac{(y_4-y_3)}{(x_4-x_3)}$

## How to draw two parallel lines?

- Draw line between  $(x_1, y_1)$  and  $(x_2, y_2)$  with any algorithms
- Learn the decision pattern
- Apply the decision pattern on line between  $(x_3, y_3)$  and  $(x_4, y_4)$
- You need not recompute the decision parameters, and can save time
